Grocery Basket Insights

What your customers buy, when they shop, and six actions to grow orders

Prepared for: Management of the online grocery store

Prepared by: Akram Ali

Date: October 2026

Data: 49,355 products · 63,100 customers · 1,048,575 orders

Tool: Microsoft Power BI

1. Summary

Your customers come back regularly for the same fresh staples, at predictable times. The biggest opportunity is to serve that routine reliably and grow basket size at the weekend.

59.9%	10.5	15.4 days	35%
of items are repeat buys	items per basket	between orders	of orders on Sun + Mon

1. **Fresh food is your business.** Bananas, berries, spinach and milk are the products customers order and reorder most. Six in ten items in every basket are repeat purchases.
2. **Demand follows a clear rhythm.** Most orders arrive between 10 am and 5 pm, and Sunday and Monday are the busiest days. Weekend baskets are about 20% larger than midweek ones.
3. **Customers return every two weeks or so.** The typical customer orders every 15 days, and a loyal group of 431 customers has placed 100 orders each.

We recommend **six actions**: protect stock of key staples, add delivery capacity at peak times, launch weekend basket offers, remind customers to reorder around day 14, start a loyalty programme for your most frequent shoppers, and bundle occasional categories with staples.

2. Your business at a glance

Measure	Figure	What it means
Products on sale	49,355	A wide range across 134 aisles and 21 departments
Customers	63,100	Each with a full order history
Repeat items	59.9%	Most of what customers buy, they have bought before
Average basket	10.5 items	Most baskets are small top-up shops
Time between orders	15.4 days	Customers shop about twice a month
Busiest hours	10 am – 5 pm	57% of orders arrive in this window
Busiest days	Sunday and Monday	35% of the week's orders

3. What customers buy

A small set of fresh staples drives most orders and almost all repeat buying.

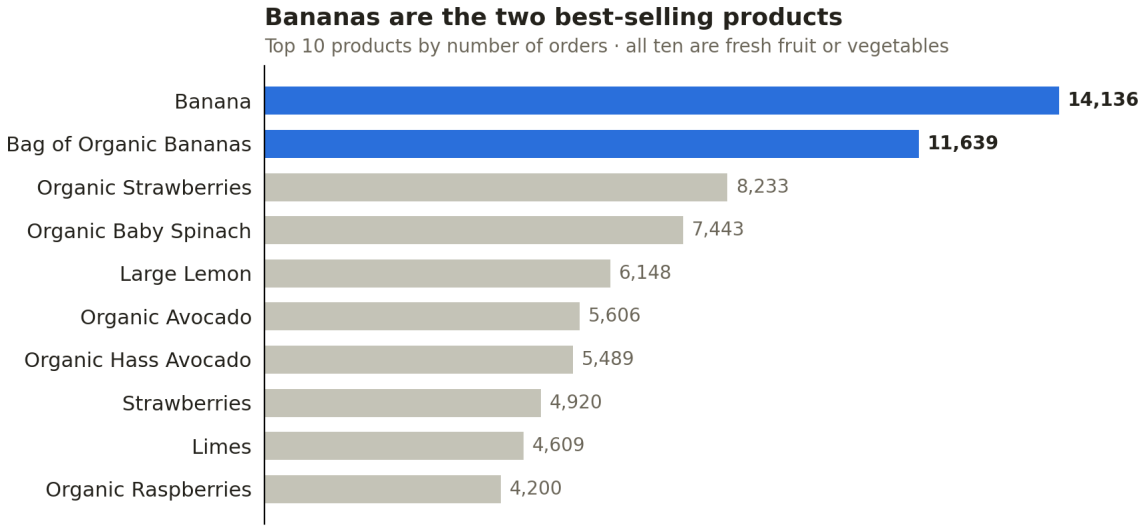

Figure 1. Top 10 products by number of orders

Best sellers. Banana is your top product (14,136 orders), followed by Bag of Organic Bananas (11,639), Organic Strawberries (8,233), Organic Baby Spinach (7,443) and Large Lemon (6,148). All ten best sellers are fruit or vegetables, and six are organic.

Repeat favourites. Milk is the most loyal category: 79% of milk items are reorders, and lactose-free and low-fat milks are reordered over 88% of the time. Water, fresh fruit, eggs and bread follow. In every department one everyday product leads repeat buying, for example Organic Whole Milk, Original Hummus and 100% Whole Wheat Bread.

Reach. Produce is bought by 74% of customers and dairy and eggs by 67%. These two departments bring customers to the store.

Weak spots. Spices, baking supplies, kitchen supplies and health and beauty aisles are reordered only 16–27% of the time. Personal care has the largest range (6,524 products) but reaches only 11% of customers.

4. When customers shop

Demand starts the week high: Sunday and Monday each bring about 180,000 orders, a third more than Thursday, the quietest day.

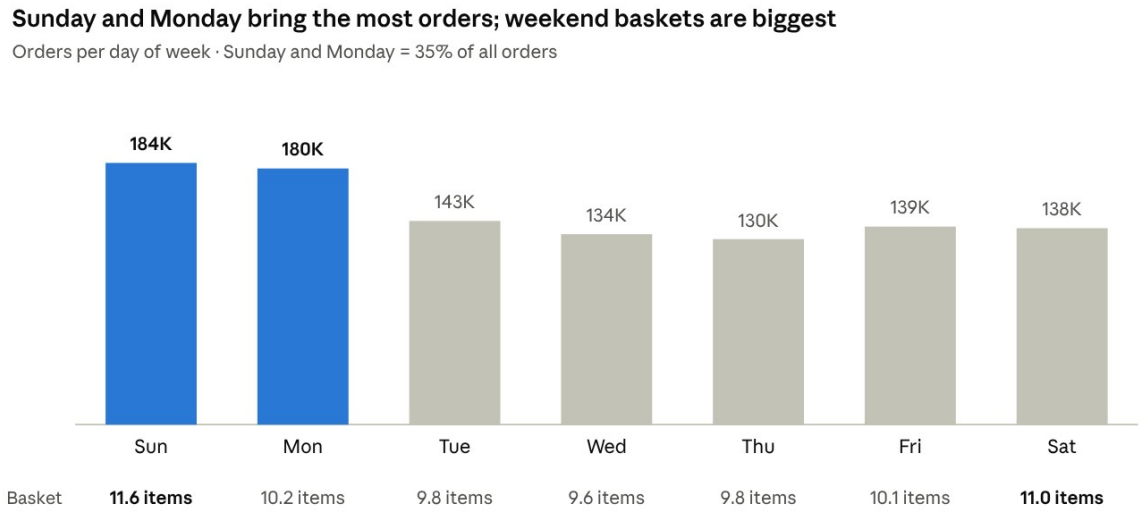

Figure 2. Orders and average basket size by day of week

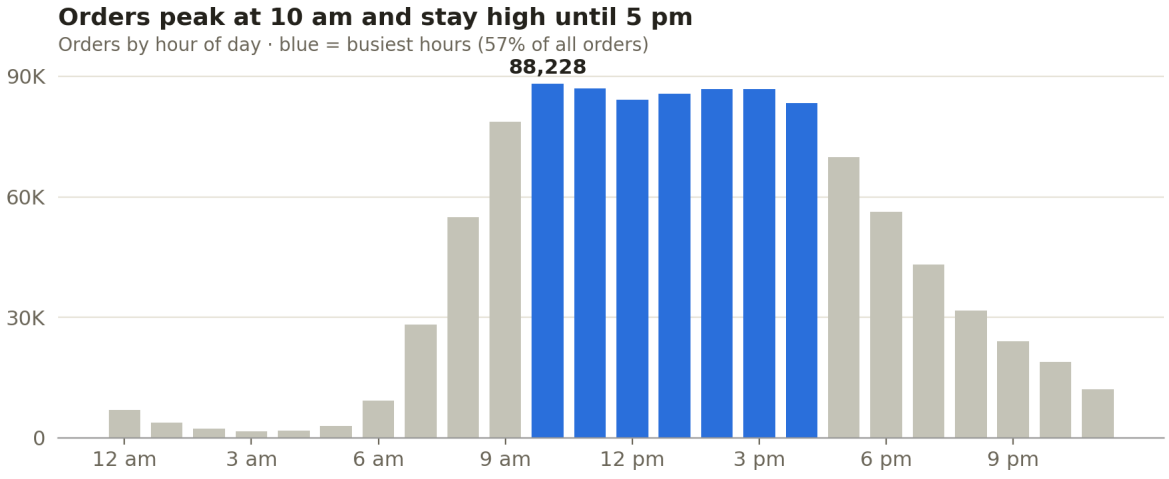

Figure 3. Orders by hour of day

Within the day, orders climb from 7 am, peak at 10 am (88,228 orders) and stay above 83,000 an hour until 5 pm. Between midnight and 6 am the store is almost idle. Weekend baskets are the largest: 11.6 items on Sunday and 11.0 on Saturday, against 9.6 on Wednesday. Most orders are small: 60% contain 10 items or fewer.

5. Who your customers are

Most of your 63,100 customers shop on a regular cycle of one to three weeks, and a small loyal core shops far more often.

How often they order	Customers	Share
Every 0–7 days	7,489	12%
Every 8–14 days	21,379	34%
Every 15–21 days	19,591	31%
Every 22–30 days	14,641	23%

- The typical customer orders every **15.4 days** and has placed **16.6 orders** (median 10).
- **431 customers** have placed 100 orders each, the highest number in the data. Together with the 7,489 weekly shoppers, they are your most valuable group.
- The 14,641 customers who wait 22–30 days between orders are the group most at risk of drifting to a competitor.

6. Recommended actions

Start with the two actions that protect today's repeat business, then add the four that grow it.

#	Action	Why	Expected benefit
1	Never run out of the top staples: milk, bananas, berries, eggs, bread. Add extra stock before Sunday and Monday	These products are reordered 70–92% of the time and drive the busiest days	Fewer missed orders and disappointed regular customers
2	Add delivery slots and staff from 10 am to 5 pm, and on Sunday and Monday	57% of orders arrive in this window; Sunday and Monday carry 35% of the week	Shorter delivery times at peak; better customer satisfaction
3	Weekend "big basket" offers, such as free delivery over a set basket size or meal bundles	Customers already buy 11–12 items at the weekend	Larger weekend baskets
4	Reorder reminders about 14 days after a customer's last order, with their usual items ready to add	The typical customer reorders every 15 days	More customers come back on time; win back the 22–30 day group
5	A loyalty programme for the 431 most frequent customers and the 7,489 weekly shoppers	A small group places a large share of orders	Keeps the most valuable customers
6	Bundle and cross-sell low-reorder aisles (spices, baking, kitchen, health and beauty) next to staples	These aisles are reordered only 16–27% of the time	More items per basket from occasional categories

7. Next steps

1. Agree which of the six actions to start this quarter.
2. Share the Power BI dashboard with the stock, delivery and marketing teams.
3. Set up the 14-day reorder reminder as a pilot and measure the return rate.
4. Refresh the analysis with the full order history once it is available.

About the data. This analysis uses the store's order database: 49,355 products, 63,100 customers and 1,048,575 orders, with product details for 99,574 orders. The export was limited to about one million rows, and 1,254 products have no aisle or department, so exact totals would be somewhat higher with the complete data. The data has no prices, so performance is measured by orders and reorders rather than revenue.
